Database Management System

Database approach to Data

Management

Database

A database is a logically coherent collection of data with some inherent meaning, representing some aspect of real world and which is designed, built and populated with data for a specific purpose.

DBMS

A Data Base Management System (DBMS) is a set of software programs that enables users to define, create and maintain a database. The DBMS also enforces necessary access restrictions and security measures in order to protect the database.

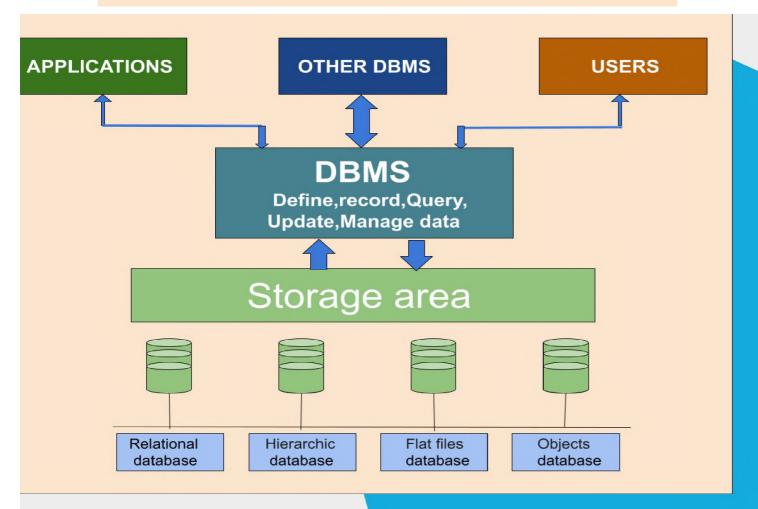

Database technology cuts through many of the problems a traditional file organization creates. Database serves many applications efficiently by centralizing the data and controlling redundant data. Rather than storing data in separate files for each application, data are stored so as to appear to users as being stored in only one location.

For example, instead of a corporation storing employee data in separate nformation systems and separate files for personne, payroll, and benefits, the corporation creates a single common human resources database
